

ABSTRACT

The water shower apparatus according to the present invention is constructed in a way to produce cold air intercepting screen having warming effects around the bather. In this water shower apparatus, the shower sprayed from the wide-angle spray nozzle of the shower system forms a shower curtain. That water shower of thin cold air intercepting screen is sprayed toward about the neck and the shoulders to the flanks of the bather. And, the shower curtain formed this way wraps about the horizontal face under the neck of the bather, the vertical face about in the vertical direction on the left and the right sides of the bather's body, and the front face centering on the lower half portion of the bather's body. This enables to intercept cold air from outside and enclose the hot air inside. Production of "cold feeling" at the time of entry of the bather into the chilled bathroom can be prevented. The entire body of the bather can be warmed with bathing.
